100X ENGINEERS / WEBINAR FUNNEL REPORT

# Token Tax Audit

DATA TO 24 OCT 2026, 13:15 IST / WEBINAR: SUN 25 OCT, 3 PM IST

SOURCES
POSTHOG (FROM 22 OCT)
RESULTS SHEET (FROM 20 OCT)

The audit is a 7-question quiz that finds a person's biggest Claude "token tax", then asks them to save a seat for the webinar "Tokenmaxxing on Claude". In four days it produced 137 completed audits and 40 people tapped the seat link. Almost all of that came from one untagged link shared on the afternoon of 23 Oct. The homepage embed adds views but very few starts.

AUDITS COMPLETED
**137**
Result rows in the sheet, test rows removed

START TO RESULT
**76%**
93 of 122 people who started reached their result

TAPPED "SAVE MY SEAT"
**40**
About 43% of the 93 people who saw a result

USE CASES SENT
**1**
Real submissions to the "custom plan" form

## What happened so far

20 Oct
Page built for Instagram-ad traffic: one question per screen, a story-style progress bar, and a pinned CTA. That evening the result screen became animated, with each leak drawn and flipped to its fix. A leak list, "The deal" card and an optional use-case form were added after the result. The CTA was pointed at the class registration link.

21 Oct
Restyled to match 100xengineers.com: Space Grotesk, coral #FE6242, light theme only.

22 Oct
Analytics went live. PostHog now records every screen reached, alongside the answers posted to the Google Sheet.

23 Oct, morning
Embedded on the 100xengineers.com homepage below the hero (tagged utm_source=website). Q1 got a "Not Claude yet" option.

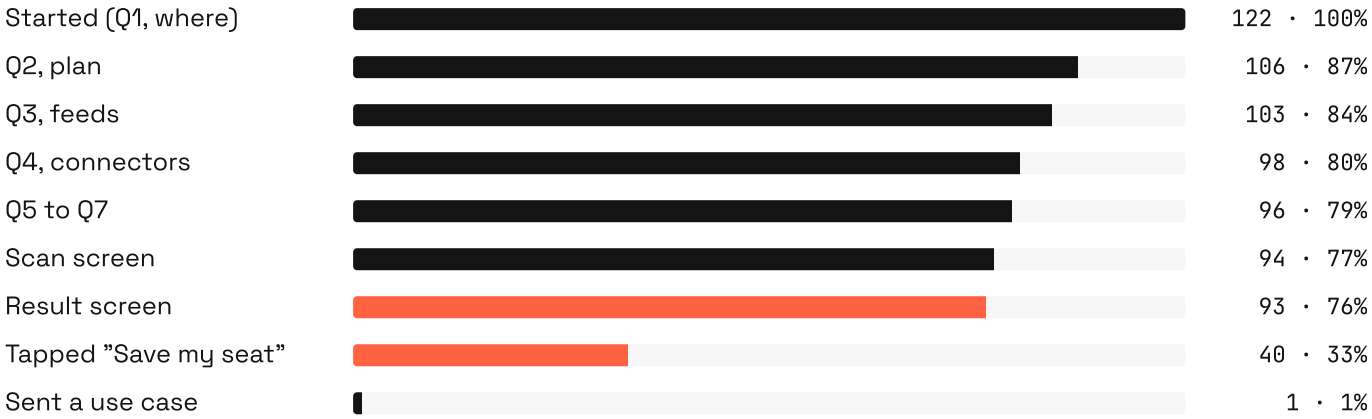

23 Oct, 4 PM to 7 PM IST
**The spike.** 95 people started the quiz in three hours, 67 of them between 4 and 5 PM. They came on an untagged direct link, two thirds on mobile. This one window holds 78% of all starts so far.

23 Oct, evening
Tracking can now tell the homepage embed from a direct link, and logs when the box is actually seen on screen. The use-case form now says what's missing and offers one-tap starter answers.

24 Oct
A quiet day: 8 starts and 6 results so far. The webinar is tomorrow.

# Analytics

## Funnel: unique people at each step (PostHog, 22 to 24 Oct)

The only real drop is between Q1 and Q2, where 13% leave. After Q2 almost nobody quits. "Save my seat" is a click on the registration link. We can't see whether those people finished registering.

## Where people came from

| SOURCE | LOADED | STARTED | RESULT | START RATE |
|---|---|---|---|---|
| Direct link, no UTM (mostly the 23 Oct spike) | 132 | 107 | 83 | 81% |
| of which mobile | 90 | 71 | 51 | 79% |
| of which desktop | 42 | 36 | 32 | 86% |
| Homepage embed (utm_source=website) | 431 | 15 | 11 | 3% |

The homepage iframe loads for nearly every homepage visitor, so "loaded" overstates it. A better measure: since 23 Oct evening, 93 people actually had the box on screen and 6 of them started (6%). People who opened the direct link started 78% of the time (14 of 18).

## By day (IST)

| DAY | LOADED | STARTED | RESULT | SHEET ROWS |
|---|---|---|---|---|
| 20 to 21 Oct (before PostHog) | n/a | n/a | n/a | 17 |
| 22 Oct | 70 | 2 | 1 | 7 |
| 23 Oct | 362 | 112 | 87 | 105 |
| 24 Oct (to 13:15) | 145 | 8 | 6 | 8 |

The sheet has more results than PostHog because it starts on 20 Oct and logs one row per distinct set of answers. Some 20 to 22 Oct rows are probably team tests.

## Who took the audit (137 results)

### Plan

| | |
|---|---|
| Pro | 54 · 39% |
| Free | 50 · 36% |
| Max | 22 · 16% |
| Team | 10 · 7% |

### Default model

| | |
|---|---|
| Opus | 62 · 45% |
| Sonnet | 49 · 36% |
| Don't know (default) | 14 · 10% |
| Haiku / Fable | 11 · 8% |

### Hits a usage limit

| | |
|---|---|
| Every week | 99 · 72% |
| Every month | 19 · 14% |
| Never | 16 · 12% |

### What they feed Claude

| | |
|---|---|
| PDFs and docs | 102 · 74% |
| Screenshots | 98 · 72% |
| Web pages | 86 · 63% |
| Logs | 60 · 44% |
| Sheets or JSON | 47 · 34% |

### Where they use Claude

| | |
|---|---|
| Claude app | 66 · 48% |
| Claude Code | 47 · 34% |
| Both | 20 · 15% |
| API / other | 3 · 2% |

### Connectors / MCP servers

| | |
|---|---|
| None | 44 · 32% |
| 1 or 2 | 37 · 27% |
| 3 to 5 | 25 · 18% |
| 5+ / unsure | 30 · 22% |

The quiz tracks are an even split: 67 App and 69 Code. 37% switch models "often" and another 45% "sometimes".

## The leaks people have

### Shown as "your biggest leak"

| | |
|---|---|
| Raw-format | 100 · 73% |
| Screenshot | 17 · 12% |
| Noisy output | 14 · 10% |
| Startup | 2 · 1% |
| Cache break | 2 · 1% |
| One-model | 1 · 1% |
| Middleman | 0 |

### Scored above zero (has the tax at all)

| | |
|---|---|
| Raw-format | 87% |
| Cache break | 83% |
| Screenshot | 72% |
| Noisy output | 62% |
| One-model | 59% |
| Middleman | 51% |
| Startup | 40% |

Cache break is the clearest gap: 83% of people have it, but it is the top leak for only 1%. It never wins because Raw-format scores higher for almost everyone.

## Insights for us

1 **One untagged link did almost all the work, and we don't know which one it was.**

78% of all starts came between 4 PM and 7 PM IST on 23 Oct, through a link with no UTM. Those visitors started 81% of the time, so the channel and the message clearly worked. We can't repeat it until we know where it was posted.

**DO** Find what went out around 4 PM on 23 Oct (community post, WhatsApp, email, story). Before the next push, give every link its own UTM, e.g. `?utm_source=whatsapp&utm_medium=community`.

2 **The homepage embed is a weak entry point.**

431 homepage loads gave 15 starts. Even counting only people who scrolled to the box, 6% started. Homepage visitors aren't there for a quiz, and a small iframe has to win them over in one glance.

**DO** Swap the iframe for a slim banner ("Find your Claude token leak in 60 seconds") that opens the full page, or measure the embed after the webinar and drop it if it stays under 10%.

3 **The quiz itself is not the problem. The result converts.**

76% of starters reach the result, and 43% of them tap "Save my seat". For a free webinar that is strong. Most people who leave do so after Q1, before they're invested.

**DO** Keep the flow as it is for tomorrow. Compare the registrations on class.100xengineers.com with the 40 taps to see how many people we lose on the registration page.

4 **The "custom token-spend plan" offer is not landing.**

One real use case came in ("Reading screenshots"), even after the 23 Oct fixes. People tap the seat CTA and stop. Writing a use case and an email is too much effort right after a result. Since the team plans to pick 10 people for custom plans, we have almost nobody to choose from.

**DO** Either ask on the registration form or during the webinar ("drop your use case in chat"), or make the starter buttons the whole form (one tap plus email).

5 **Nearly everyone gets the same answer.**

73% are told Raw-format is their biggest leak. That is true to the data (74% feed PDFs, 72% screenshots), but the result can feel generic, and people comparing results will notice. It also hides Cache break, which 83% have.

**DO** After the webinar, re-weight the scoring or show the top two leaks. For tomorrow, the people in the room will mostly have the Raw-format result.

## 6 What the audience tells us for tomorrow's session.

- **Limits are the pain.** 72% hit a usage limit every week. Frame each fix as "more messages before the limit", not as tokens saved.
- **Mostly paying users.** 63% are on Pro, Max or Team, and 45% default to Opus. The "right model for the job" segment will hit home.
- **Half App, half Code.** Each demo needs both versions. Don't run a Claude Code-only session.
- **Lead with:** PDFs and raw files, screenshots, then cache breaks from switching models (82% switch at least sometimes).
- **Keep connectors/MCP short.** 32% use none, and only 40% have the Startup tax.

## 7 Housekeeping.

The sheet has 4 test rows and 2 team use-case rows. Delete them before anyone reports from it. Remember that the Apps Script must be redeployed for the source/UTM columns to fill in.

Method: PostHog counts unique people (one per browser) on site = token-tax-audit. The sheet figures exclude rows marked TEST, the probe row and the team's own use-case rows. All numbers are one-off queries, not saved insights.
